last updated September 23, 2015.

dxfgrabber is a Python library to grab information from DXF drawings - all DXF versions supported.

Python compatibility: dxfgrabber is tested with CPython 2.7, CPython 3.4 and PyPy.

License: dxfgrabber is licensed under the MIT license.

simple usage:

```
dxf = dxfgrabber.readfile("drawing.dxf")
print("DXF version: {}".format(dxf.dxfversion))
header_var_count = len(dxf.header) # dict of dxf header vars
layer_count = len(dxf.layers) # collection of layer definitions
block_definition_count = len(dxf.blocks) # dict like collection of block definitions
entity_count = len(dxf.entities) # list like collection of entities
```

Contents 1

2 Contents

Read DXF files

```
readfile (filename[, options=None])
```

Read DXF file *filename* from the file system, and returns an object *Drawing*. *options* is a dict with options for reading DXF files.

```
read (stream[, options=None])
```

Like readfile(), but reads the DXF data from a stream. stream only requires a method readline()

1.1 Options dict for reading DXF files

default options:

```
DEFAULT_OPTIONS = {
    "grab_blocks": True,
    "assure_3d_coords": False,
    "resolve_text_styles": True,
}
```

key	description
grab_blocks	if True read block definitions from DXF file, else the dict Drawing.blocks is empty.
as-	guarantees (x, y, z) tuples for ALL coordinates
sure_3d_coords	
re-	if True Text, Attrib, Attdef and MText attributes will be set by the associated text
solve_text_styles	style if necessary

Helper Functions

aci_to_true_color(index)

Returns the DXF default true color value for AutoCAD Color Index *index* as *TrueColor* object. Raises *IndexError* for *index* < 0 and *index* > 255.

Drawing Content

class Drawing

Contains all collected data from the DXF file.

Drawing.dxfversion

DXF version as string.

DXF	AutoCAD Version
AC1009	AutoCAD R12
AC1015	AutoCAD R2000
AC1018	AutoCAD R2004
AC1021	AutoCAD R2007
AC1024	AutoCAD R2010
AC1027	AutoCAD R2013

Drawing.encoding

content encoding, default is cp1252

Drawing.filename

filename if read from a file.

Drawing.header

Contains all the DXF header vars in a *dict* like object. For explanation of DXF header vars and their content see the DXF specifications from Autodesk. Header var content are basic Python types like *string*, *int*, and *float* as simple types and *tuples of float values* for 2D- and 3D points.

Drawing.layers

Contains all layer definitions in an object of type LayerTable.

Drawing.styles

Contains all text style definitions in an object of type StyleTable.

Drawing.linetypes

Contains all linetype definitions in an object of type LinetypeTable.

Drawing.blocks

Contains all block definitions in a *dict* like object of type *BlocksSection*.

Drawing.entities

Contains all drawing entities in a *list* like object of type *EntitySection*.

Drawing.objects

Contains DXF objects from the objects section in a *list* like object of type *EntitySection*.

Drawing.modelspace()

Iterate over all DXF entities in modelspace.

```
Drawing.paperspace()

Iterate over all DXF entities in paperspace.
```

3.1 Layer Table

3.2 Layer

class Layer

```
Layer.name
Layer name as string

Layer.color
Layer color as int in range 1 to 255.

Layer.linetype
Layer linetype as string.

Layer.locked
type is bool

Layer.frozen
type is bool

Layer.on
type is bool
```

3.3 Style Table

```
class StyleTable
```

```
Contains all text style definitions as objects of type Style.
```

```
StyleTable.get (name)
Return text style name as object of type Style. Raises KeyError
StyleTable.__getitem__ (name)
Support for index operator: dwg.styles[name]
```

```
StyleTable.names (name)
     Returns a sorted list of all text style names.
StyleTable.__iter__()
     Iterate over all text styles, yields Style objects.
StyleTable.__len__()
     Returns count of text styles, support for standard len () function.
3.4 Style
class Style
Style.name
     Text style name.
Style.height
```

Text fixed height as *float*, is 0 for no fixed height.

Style.width

Text width factor.

Style.oblique

Text oblique angle. (0 deg = veritcal)

Style.is backwards

True if text is mirrored in X.

Style.is_upside_down

True if text is mirrored in Y.

Style.font

Primary font file name

Style.bigfont

Bigfont file name

3.5 Linetype Table

class LinetypeTable

Contains all linetype definitions as objects of type Linetype.

LinetypeTable.get (name)

Return linetype *name* as object of type *Linetype*. Raises *KeyError*

LinetypeTable.__getitem__(name)

Support for index operator: dwg.linetypes[name]

LinetypeTable.names (name)

Returns a sorted list of all linetype names.

LinetypeTable.__iter__()

Iterate over all linetypes, yields *Linetype* objects.

LinetypeTable.__len__()

Returns count of linetypes, support for standard len() function.

3.4. Style 9

3.6 Linetype

class Linetype

TODO

3.7 Blocks Section

```
class BlocksSection
    Contains all block definitions as objects of type Block.

BlocksSection.__len__()
    Returns count of blocks, support for standard len() function.

BlocksSection.__iter__()
    Iterates over blocks, yields Block objects.

BlocksSection.__contains__(self, name)
    Returns True if a block name exists, support for standard in operator.

BlocksSection.__getitem__(name)
    Returns block name, support for the index operator: block = dwg.blocks[name]. Raises KeyError

BlocksSection.get (name[, default=None])
    Returns block name if exists or default.
```

3.8 Entity Section

class EntitySection

Contains all drawing entities.

```
EntitySection.__len__()
```

Returns count of entities, support for standard len() function.

```
EntitySection.__iter__()
```

Iterates over all entities.

```
EntitySection.__getitem__(index)
```

Returns entity a location *index*, *slicing* is possible, support for the index operator dwg.entity = entities[index]. Raises *IndexError*

example for accessing entities:

```
dwg = dxfgrabber.readfile('test.dxf')
all_layer_0_entities = [entity for entity in dwg.entities if entity.layer == '0']
```

Entity Types

4.1 Base Class Shape

class Shape

Base class for all drawing entities.

Shape.paperspace

True for paperspace and False for modelspace.

Shape.dxftype

DXF entity name, like CIRCLE or LINE

Shape.layer

Layer name as string

Shape.linetype

Linetype as *string* or *None*, *None* means linetype by layer.

Shape.thickness

Element thickness as float.

Shape.extrusion

Vector as (x, y, z) tuple, indicate the entity's extrusion direction. Default = (0, 0, 1)

Shape.ltscale

Linetype scale as *float*

Shape.invisible

True if entity is invisible.

Shape.color

Entity color as ACI (AutoCAD Color Index) where 256 means color by layer and 0 means color by block.

Shape.true_color

Entity color as 0x00RRGGBB 24-bit integer value, returns a TrueColor object. Value is None if not set.

Shape.transparency

Entity transparency as float from 0.0 to 1.0, 0.0 is opaque and 1.0 is 100% transparent. Value is None if not set.

${\tt Shape.shadow_mode}$

Value	Description
0	Casts and receives shadows
1	Casts shadows
2	Receives shadows
3	Ignores shadows
None	if not set

class TrueColor (int)

Represents a true color value as int. Create new TrueColor objects:

```
t = TrueColor(0xAABBCC)
t = TrueColor.from_rgb(0xAA, 0xBB, 0xCC)
t = TrueColor.from_aci(1) # ACI for red (AutoCAD Color Index)
```

Unpack TrueColor:

```
r, g, b = t.rgb()  # fastest way
r, g, b = t  # unpacking by t.__getitem__()

red = t.r
green = t.g
blue = t.b

red = t[0]
green = t[1]
blue = t[2]
```

TrueColor.r

Red value as int.

${\tt TrueColor.g}$

Green value as int.

TrueColor.b

Blue value as int.

TrueColor.rgb()

Returns a tuple (red, green, blue) each value in range 0 to 255. (255, 255, 255) = white.

TrueColor.from_rgb(r, g, b)

Returns a TrueColor object.

TrueColor.from_aci (index)

Returns the DXF default true color value for AutoCAD Color Index *index* as *TrueColor* object. Raises *IndexError* for *index* < 1 and *index* > 255.

4.2 Block

class Block (Shape)

Block.basepoint

Base point of block definition as 2D- or 3D point of type tuple.

Block.name

Block name as string

Block.flags

Block flags as int, for explanation see the DXF specifications from Autodesk and see also Block.is_... properties.

Block.xrefpath

Path to external reference as string

Block.is xref

True if block is an external reference.

Block.is_xref_overlay

True if block is an external overlay reference.

Block.is_anonymous

True if block is an anonymous block, created by hatch or dimension.

Block.__iter__:

Support for iterator protocol, iterates over all block entities.

Block.__getitem__(index):

Returns block entity at location *index*, *slicing* is supported.

Block.__len__():

Returns count of block entities, support for standard len() function.

4.3 Line

```
class Line (Shape)
```

Line.start

Start point of line (x, y[, z]) as tuple

Line.end

End point of line (x, y[, z]) as tuple

4.4 Point

```
class Point (Shape)
```

Point.point

Location of point (x, y[, z]) as tuple

4.5 Circle

class Circle (Shape)

Circle.center

Location of circle center point (x, y[, z]) as *tuple*

Circle.radius

Circle radius as float

4.6 Arc

class Arc (Shape)

4.3. Line 13

Arc.center

Location of arc center point (x, y[, z]) as tuple

arc.radius

Arc radius as float

arc.startangle

Arc startangle in degrees as *float*. (full circle = 360 degrees)

arc.endangle

Arc endangle in degrees as *float*. (full circle = 360 degrees)

4.7 Solid

class Solid (Shape)

A solid filled shape with 4 points. For Triangles point 3 and point 4 has the same location.

Solid.points

List of points (x, y[, z]) as tuple.

4.8 Trace

class Trace (Solid)

Same as Solid.

4.9 Face

class Face (Trace)

A solid filled 3D shape with 4 points. For Triangles point 3 and point 4 has the same location. DXF entity 3DFACE

Face.points

List of points (x, y, z) as tuple.

Face.is_edge_invisible (index)

Returns True if edge *index* is invisible, index in [0, 1, 2, 3].

4.10 Text

The attributes height, width, oblique, is_backwards and is_upside_down are defined in the associated Style object, if the value of these attributes are θ (height, width) or None (oblique, is_backwards, is_upside_down).

If the import option "resolve_text_styles" is *True*, all the above mentioned attributes and *font* and *bigfont* already have the 'final' value, no need to look into the *Style* object.

class Text (Shape)

${\tt Text.insert}$

Location of text (x, y, z) as tuple.

Text.text

Text content as string.

Text.height

Text height as *float*, if 0 you have to look into the styles table <code>Drawing.styles</code> with <code>Text.style</code> as key.

Text.width

Text width factor.

Text.oblique

Text oblique angle. (0 deg = veritcal)

Text.rotation

Rotation angle in degrees as *float*. (full circle = 360 degrees)

Text.style

Text style name as *string*

Text.halign

Horizontal alignment as int.

Value	Alignment
0	Left
1	Center
2	Right
3	Aligned (if vertical alignment = 0)
4	Middle (if vertical alignment = 0)
5	Fit (if vertical alignment = 0)

Text.valign

Vertical alignment as int.

Value	Alignment
0	Baseline
1	Bottom
2	Middle
3	Тор

Text.is_backwards

True if text is mirrored in X.

Text.is_upside_down

True if text is mirrored in Y.

Text.alignpoint

Second alignment point as tuple or *None*.

Text.font

Font name as string, if import option resolve_text_styles is *True* else "".

Text.bigfont

Bigfont name as string, if import option resolve_text_styles is *True* else "".

Text.plain_text()

Get text content without formatting codes like \$\$u.

4.10. Text 15

4.11 Attrib

class Attrib (Text)

A text entity, in usual cases attached to a block reference entity Insert, inherits from Text.

Attrib.tag

The attribute tag as *string*.

4.12 Attdef

Same as Attrib, but located in a block definition entity Block.

4.13 Insert

```
class Insert (Shape)
```

Insert.name

Name of block definition as string.

Insert.insert

Location of block reference (x, y, z) as tuple.

Insert.rotation

Rotation angle in degrees as *float*. (full circle = 360 degrees)

Insert.scale

(x, y, z) block scaling as *tuple*, default is (1.0, 1.0, 1.0)

Insert.row_count

Row count for multiple block references.

Insert.col_count

Column count for multiple block references.

Insert.row_spacing

Row distance for multiple block references.

Insert.col_spacing

col distance for multiple block references.

Insert.attribs

List of *Attrib* entities attached to the *Insert* entity.

Insert.find_attrib(tag):

Get Attrib entity by tag, returns None if not found.

4.14 Polyline

class Polyline (Shape)

Multiple 2D- or 3D vertices connected by lines. The DXF entity *POLYLINE* is also used to define *Polyfaces* and *Polymeshes*, dxfgrabber defines separated classes for this entities see: *Polyface* and *Polymesh*.

Polyline.is_closed

True if polyline is closed.

Polyline.mode

Returns the polyline mode: polyline2d, polyline3d or spline2d.

Polyline.spline_type

If polyline is a 2D spline: quadratic_bspline, cubic_bspline, bezier_curve else None.

Polyline.default_start_width

Default line segment start width, if not set in vertex entity.

Polyline.default end width

Default line segment end width, if not set in vertex entity.

Polyline.points

List of all vertex locations as (x, y[, z]) tuple. If this polyline is a 2d spline these points are just the fit points.

Polyline.controlpoints

List of all control points as (x, y[, z]) *tuple*, if this polyline is a 2d spline.

Polyline.tangents

List of all vertex tangent angles as *float* in degrees or *None* if not defined. (Just for fit points)

Polyline.width

List of all vertex width values as (start_width, end_width) tuple. Just for fit points if this polyline is a 2D spline.

Polyline.bulge

List of all vertex bulge values as *floats*.

Polyline.__getitem__(index)

Returns vertex *index* as *Vertex* entity. support for standard operator vertex = polyline[index]. Raises *IndexError*

Polyline.__len__()

Returns count of vertices.

Polyline.__iter__()

Iterate of all vertices, as Vertex entity.

4.15 Vertex

class Vertex (Shape)

Vertex.location

Location as (x, y, z)-tuple.

Vertex.start_width

Vertex.end_width

Vertex.bulge

The bulge is the tangent of one fourth the included angle for an arc segment, made negative if the arc goes clockwise from the start point to the endpoint. A bulge of 0 indicates a straight segment, and a bulge of 1 is a semicircle. If you have questions ask *Autodesk*.

Vertex.tangent

Curve fitting tangent in degrees as *float* or *None*. (full circle = 360 degrees)

4.15. Vertex 17

4.16 Polyface

class Polyface (Shape)

Dxftype is *POLYFACE*, which is a *POLYLINE* DXF entity.

Polyface.vertices

List of all Polyface vertices a Vertex object.

Polyface.__getitem__(index)

Returns face index as SubFace object. support for standard operator face = polyface[index]. Raises IndexError

Polyface.__len__()

Returns count of faces.

Polyface.__iter__()

Iterate of all faces, as SubFace objects.

Polyface.smooth_type

Smooth surface type; integer codes, not bit-coded:

Value	Description
0	No smooth surface fitted
5	Quadratic B-spline surface
6	Cubic B-spline surface
8	Bezier surface

4.16.1 SubFace

class SubFace

A SubFace describes a single face of a Polyface.

SubFace.face_record

Face record vertex, the basic DXF structure of faces, where you can get the DXF attributes of the face like color or linetype: subface.face_record.color

SubFace.__len__()

Returns count of vertices 3 or 4.

SubFace.__getitem__(pos):

Returns vertex at index pos as Vertex object

SubFace.__iter__():

Returns a list of the face vertices as (x, y, z)-tuples.

SubFace.indices():

Returns a list of vertex indices, get vertex by index from Polyface.vertices[index].

SubFace.is edge visible(pos):

Returns *True* if face edge *pos* is visible else *False*.

4.17 Polymesh

class Polymesh (Shape)

Dxftype is *POLYMESH*, which is a *POLYLINE* DXF entity.

A *Polymesh* is a grid of m x n vertices, where every vertex has its own 3D location.

Polymesh.mcount

Count of vertices in m direction as int.

Polymesh.ncount

Count of vertices in n direction as int.

Polymesh.is mclosed

True if *Polymesh* is closed in m direction.

Polymesh.is nclosed

True if *Polymesh* is closed in n direction.

Polymesh.m_smooth_density

Smooth surface M density.

Polymesh.n_smooth_density

Smooth surface N density.

Polymesh.smooth_type

Smooth surface type; integer codes, not bit-coded:

Value	Description
0	No smooth surface fitted
5	Quadratic B-spline surface
6	Cubic B-spline surface
8	Bezier surface

Polymesh.get_vertex(pos)

Returns the Vertex at pos, where pos is a tuple (m, n). First vertex is (0, 0).

Polymesh.get_location(pos)

Returns the location (x, y, z) as tuple at pos, where pos is a tuple (m, n). First vertex is (0, 0).

4.18 LWPolyline

class LWPolyline (Shape)

LWPolyline is a lightweight only 2D Polyline.

LWPolyline.points

List of 2D polyline points as (x, y) tuple, or (x, y, z=0) tuple if option assure_3d_points is True.

LWPolyline.width

List of (start_width, end_width) values. To be ignored if *const_width* is not 0.

LWPolyline.bulge

List of bulge values as float

LWPolyline.const_width

Polyline has this constant width, if this value is not 0.

LWPolyline.is_closed

True if the polyline is closed.

LWPolyline.elevation

LWPolyline.__len__()

Returns the count of polyline points.

LWPolyline.__getitem__(index)

Returns polyline point at position index, slicing is supported. Raises IndexError

4.18. LWPolyline 19

LWPolyline.__iter__()
Iterate over all polyline points.

4.19 Ellipse

class Ellipse (Shape)

Ellipse.center

Location of ellipse center point (x, y[, z]) as tuple

Ellipse.majoraxis

End point of major axis (x, y[, z]) as tuple

Ellipse.ratio

Ratio of minor axis to major axis as float.

Ellipse.startparam

Start parameter (this value is 0.0 for a full ellipse).

Ellipse.endparam

End parameter (this value is 2pi for a full ellipse)

4.20 Ray

class Ray (Shape)

Ray.start

Location of the ray start point (x, y, z) as tuple

Ray.unitvector

Ray direction as unit vector (x, y, z) as tuple

4.21 XLine

class XLine (Ray)

Same as Ray, except a XLine (construction line) has no beginning and no end.

4.22 Spline

class Spline (Shape)

Spline.flags

Binary coded flags, constants stored in dxfgrabber.const.

Spline.flags	value
SPLINE_CLOSED	1
SPLINE_PERIODIC	2
SPLINE_RATIONAL	4
SPLINE_PLANAR	8
SPLINE_LINEAR	16 (a linear spline is also a planar spline)

Spline.degree

Degree of the spline curve as int

Spline.starttangent

Start tangent as (x, y, z) as tuple or None

Spline.endtangent

End tangent as (x, y, z) as tuple or None

Spline.controlpoints

List of control points (x, y, z) as tuple

Spline.fitpoints

List of fit points (x, y, z) as *tuple*

Spline.knots

List of knot values as float

Spline.weights

List of weight values as float

Spline.normalvector

Normal vector if spline is planar else *None*.

Spline.is_closed

Spline.is_periodic

Spline.is_rational

Spline.is_planar

Spline.is_linear

4.23 Helix

3D spiral; Helix is also a Spline.

class Helix (Spline)

Helix.helix version

Tuple (main version, maintainance version)

Helix.axis_base_point

Helix axis base point as (x, y, z) as *tuple*.

Helix.start_point

Helix start point as (x, y, z) as *tuple*.

Helix.axis_vector

Helix axis vector as (x, y, z) as *tuple*.

Helix.radius

Helix.turns

Count of turns.

Helix.turn_height

Height of one turn.

Helix.handedness

0 = left; 1 = right;

4.23. Helix 21

Helix.constrain

0 = Constrain turn height; 1 = Constrain turns; 2 = Constrain height

4.24 MText

The height attribute is defined in the associated Style object, if the value of height is 0.

If the import option "resolve_text_styles" is *True*, height, font and bigfont already have the 'final' value, no need to look into the Style object.

class MText (Shape)

Multi line text entity.

MText.insert

Location of text (x, y, z) as *tuple*.

MText.rawtext

Whole text content as one string.

MText.height

Text height as float

MText.rect_width

Reference rectangle width as *float* in drawing units.

MText.horizontal width

Horizontal width of the characters that make up the MText entity. This value will always be equal to or less than the MText.rect_width value. In drawing units as float.

MText.vertical_height

Vertical height of the MText entity in drawing units as *float*.

MText.linespacing

Text line spacing as *float*, valid from 0.25 to 4.00.

MText.attachmentpoint

Text attachment point as int.

Value	Description
1	Top left
2	Top center
3	Top right
4	Middle left
5	Middle center
6	Middle right
7	Bottom left
8	Bottom center
9	Bottom right

MText.style

Text style name as *string*.

MText.xdirection

X-Axis direction vector as (x, y, z) as tuple. (unit vector)

MText.font

22

Font name as string, if import option "resolve_text_styles" is *True* else "".

MText.bigfont

Bigfont name as string, if import option "resolve_text_styles" is *True* else "".

```
MText.lines()
     Returns a list of lines. It is the MText.rawtext splitted into lines by the \P character.
MText.plain_text(split=False)
     Tries to remove format codes, returns a single string if split is False else multiple lines as list of strings without
      ۱n.
4.25 Sun
class Sun (Entity)
     Sun representation. SUN is not a graphical object and resides in the objects section Drawing.objects.
Sun.version
Sun.status
     Boolean value: on/off
Sun.sun_color
     Light color as ACI color index 1 - 255; 256 = BYLAYER; None if unset
Sun.intensity
Sun.shadows
     Boolean value
Sun.date
     A Python standard datetime.datetime object.
Sun.daylight_savings_time
     Boolean value
Sun.shadow_type
     0 = \text{Ray traced shadows}; 1 = \text{Shadow maps}
Sun.shadow_map_size
Sun.shadow_softness
4.26 Light
class Light (Shape)
     Defines a light source.
Light.version
Light.name
Light.light_type
     distant = 1; point = 2; spot = 3
Light.status
     Boolean value: on/off?
Light.light_color
     Light color as ACI color index 1 - 255; 256 = BYLAYER; None if unset
```

4.25. Sun 23

Light color as 24-bit RGB color 0x00RRGGBB, None if unset

Light.true_color

```
Light.plot_glyph
     Boolean value
Light.intensity
Light.position
     3D position of the light source as (x, y, z) tuple.
Light.target
     3D target location of the light, determines the light direction as (x, y, z) tuple.
Light.attenuation_type
     0 = None; 1 = Inverse Linear; 2 = Inverse Square
Light.use_attenuation_limits
     Boolean value
Light.attenuation_start_limit
Light.attenuation_end_limit
Light.hotspot_angle
Light.fall_off_angle
Light.cast_shadows
     Boolean value
Light.shadow type
     0 = \text{Ray traced shadows}; 1 = \text{Shadow maps}
Light.shadow_map_size
Light.shadow_softness
4.27 Mesh
```

class Mesh (Shape)

3D mesh entity similar to the *Polyface* entity.

Mesh.version

Mesh.blend_crease

Boolean value (on/off)

Mesh.subdivision levels

Mesh.vertices

List of 3D vertices (x, y, z).

Mesh.faces

List of mesh faces as tuples of vertex indices (v1, v2, v3, ...). Indices are 0-based and can be used with the mesh.vertex list:

```
first_face = mesh.faces[0]
first_vertex = mesh.vertices[first_face[0]]
```

Mesh.edges

List of mesh edges as 2-tuple of vertex indices (v1, v2). Indices are 0-based and can be used with the mesh vertex list:

```
first_edge = mesh.edges[0]
first_vertex = mesh.vertices[first_edge[0]]
```

Mesh.edge_crease_list

List of float values, one for each edge.

Mesh.get face (index)

Returns a tuple of 3D points ((x1, y1, z1), (x2, y2, z2), ...) for face at position *index*.

Mesh.get_edge(index)

Returns a 2-tuple of 3D points ((x1, y1, z1), (x2, y2, z2)) for edge at position *index*.

4.28 **Body**

class Body (Shape)

ACIS based 3D solid geometry.

Body.acis

SAT (Standard ACIS Text) data as list of strings. AutoCAD stores the ACIS data since DXF version AC1027 (R21013) as SAB (Standard ACIS Binary) data in the undocumented (2014-05-06) section ACDSDATA and acis is a binary string.

Body.is_sat

Is *True* if data is stored as SAT, no guarantee for presence of data, but acis is a list of strings for sure.

Body.is_sab

Is *True* if data is stored as SAB and acis is a binary string.

4.29 Region

class Region (Body)

ACIS based 2D enclosed areas.

4.30 3DSolid

class 3DSolid (Body)

ACIS based 3D solid geometry.

4.31 Surface

class Surface (Body)

ACIS based 3D freeform surfaces.

4.32 PlaneSurface

class PlaneSurface (Surface)

ACIS based 3D plane surfaces.

4.28. Body 25

Howtos

5.1 Open a DXF file

Open files from file system:

```
dwg = readfile("myfile.dxf")
```

To read file from a stream use: read()

5.2 Query Header Variables

The HEADER section of a DXF file contains the settings of variables associated with the drawing.

Example:

```
dxfversion = dwg.header['$ACADVER']
```

For available HEADER variables and their meaning see: DXF Reference

5.3 Query Entities

All entities of the DXF drawing, independent from *modelspace* or *paperspace*, resides in the *Drawing.entities* attribute and is an *EntitySection* object. Iterate over all entities with the in operator:

```
all_lines = [entity for entity in dwg.entities if entity.dxftype == 'LINE']
all_entities_at_layer_0 = [entity for entity in dwg.entities if entity.layer == '0']
```

5.4 Query Blocks

Block references are just DXF entities called INSERT.

Get all block references for block TestBlock:

```
references = [entity for entity in dwg.entities if entity.dxftype == 'INSERT' and entity .name == 'Tes
```

See available attributes for the *Insert* entity.

To examine the Block content, get the block definition from the blocks section:

```
test_block = dwg.blocks['TestBlock']
```

and use the in operator (Iterator protocol):

```
circles_in_block = [entity for entity in test_block if entity.dxftype == 'CIRCLE']
```

5.5 Layers

Layers are nothing special, they are just another attribute of the DXF entity, *dxfgrabber* stores the layer as a simple *string*. The DXF entity can inherit some attributes from the layer: *color*, *linetype*

To get the real value of an attribute value == BYLAYER, get the layer definition:

```
layer = dwg.layers[dxf_entity.layer]
color = layer.color if dxf_entity.color == dxfgrabber.BYLAYER else dxf_entity.color
linetype = layer.linetype if dxf_entity.linetype is None else dxf_entity.linetype
```

Layers can be <code>locked</code> (if <code>True</code> else unlocked), on (if <code>True</code> else off) or <code>frozen</code> (if <code>True</code> else thawed).

5.6 Layouts (Modelspace or Paperspace)

dxfgrabber just supports the *paperspace* attribute, it is not possible to examine in which layout a paperspace object resides (DXF12 has only one paperspace).

Get all *modelspace* entities:

```
modelspace_entities = [entity for entity in dwg.entities if not entity.paperspace]
```

shortcuts since 0.5.1:

```
modelspace_entities = list(dwg.modelspace())
paperspace_entities = list(dwg.paperspace())
```

28 Chapter 5. Howtos
